

# Data backup with AUVESY Image Service

11.10.2019 11:10

Do you want to **automatically create images** of your **Windows PCs** or **servers** in order to quickly recover important data in case of disaster?

The solution: the **AUVESY Image Service**. This will allow you to create jobs that can then be used to schedule the automatic creation of images.

Depending on the configuration of versiondog, the image and/or link to the image is available in the versiondog backup. versiondog can then be used to compare the metadata of each image. If the hardware of the backed up PC changes during a scheduled job creation, a message will appear warning that the older images may not be compatible with the changed or new PC.

**Drive Snapshot** is used to restore images. The DriveSnapshot.exe is provided with each image generated by the AUVESY Image Service. You do not require a license in order to restore images with Drive Snapshot.

**The AUVESY Image Service can be installed by:**

- Remotely by using Windows tools/services
- Using available software distribution tools
- Manually

These images can be saved on the versiondog server or on a network drive. The **temporary drive** can also be used to map **different authorization structures**(see image below).
